

Auth Service

Overview

Authentication service handles user login, session management, and profile operations.

Direction

Bidirectional — sends auth requests, returns user data and session tokens.

Protocol

- HTTPS / REST API
- JSON request/response bodies
- Cookie-based sessions (httpOnly, secure)

Authentication

- OAuth 2.0 client credentials for service-to-service
- Password stored as bcrypt hash

Endpoints

Endpoint	Method	Purpose
/api/auth/login	POST	User login
/api/auth/logout	POST	User logout
/api/auth/change-password	POST	Password change
/api/users/profile	GET	Get user profile
/api/users/profile	PUT	Update user profile

Data Flow

```
User → Login Screen → POST /api/auth/login → Auth Service
                        ↓
                    Session cookie set
                        ↓
                    Chat screen loaded
```

Failure Handling

Failure	Response	Recovery
---------	----------	----------

Failure	Response	Recovery
Invalid credentials	401 Unauthorized	Allow retry
Account suspended	403 Forbidden	Show suspension message
Server error	500 Internal Error	Retry with backoff
